

IT 341 Introduction to System Administration

Project 0 – Assessing Linux CLI Skills

After you have taken the diagnostic, please make contact with your class partner and carry out the following instructions:

1. You and your partner should trade your copies of the diagnostic, with your answers to the questions, with one another.
2. Go over each question that your partner was able to answer, and to the best of your ability, try to evaluate your partner's answer. Consider issues such as...will it get the job done or not? Was there a better way to do it?
3. Take note of any questions you do not feel able to evaluate and determine why. What aspect of the command line are you dealing with here?
4. Upon finishing the evaluations, look over the official answers.
5. With your partner, compare/contrast your answers with the official ones.
6. Answer the following questions in your lab report, as well as describing the process of going through the preceding steps:
 - a. Which questions did you complete successfully? Which Linux CLI topics did you understand the most fully? (*Question numbers alone are not sufficient!*)
 - b. Which questions did you struggle with the most? What topics did you find the most difficult? (*Question numbers alone are not sufficient!*)
 - c. Were there any questions you were unable to answer, at all? Why?
 - d. Where do you need to improve the most in your CLI abilities?
 - e. How you plan on achieving this improvement? Please be *specific* about any steps you plan to take -- and any resources you plan to use -- for improving in these areas.
